

An illustration showing two hands, one in a red sleeve and one in a blue sleeve, holding a strip of binary code (0s and 1s) that curves across the frame. The background is a grid of green and yellow squares.

Binary Numbers

What is a Number?

-

6/6/2019

Sacramento State - Cook - GSc 35 - Summer 2019

Base 10 Number

The number 1783 is ...

10^4	10^3	10^2	10^1	10^0
10000	1000	100	10	1
0	1	7	8	3

$$1000 + 700 + 80 + 3 = 1783$$

652019

Sacramento State - Cook - CSc 35 - Summer 2019

Binary Number Example

The number 1010 1001 is ...

2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0
128	64	32	16	8	4	2	1
1	0	1	0	1	0	0	1

$$128 + 32 + 8 + 1 = 169$$

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

Binary Number Example

The number 1101 1011 is ...

2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0
128	64	32	16	8	4	2	1
1	1	0	1	1	0	1	1

$$128 + 64 + 16 + 8 + 2 + 1 = 219$$

6/5/2019

Sacramento State - Cook - CSc 35 - Summer 2019

Hexadecimal Numbers

- Writing out long binary numbers is cumbersome and error prone
- As a result, computer scientists often write computer numbers in hexadecimal
- Hexadecimal is base-16
 - We only have 0...9 to represent digits
 - So, hexadecimal uses **A...F** to represent **10...15**

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

7

Hexadecimal Numbers

Hex	Decimal	Binary	Hex	Decimal	Binary
0	0	0000	8	8	1000
1	1	0001	9	9	1001
2	2	0010	A	10	1010
3	3	0011	B	11	1011
4	4	0100	C	12	1100
5	5	0101	D	13	1101
6	6	0110	E	14	1110
7	7	0111	F	15	1111

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

8

Hex Example

The number **A2C** is ...

16^3	16^2	16^1	16^0
4096	256	16	1
0	A	2	C

$$(10 \times 256) + (2 \times 16) + (12 \times 1) = 2604$$

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

9

Converting Binary to Hex = Easy

- Since $16 = 2^4$, a single hex character can represent a total of 4 bits
- Byte can be represented with only 2 hex digits!
- When looking at raw data, editors, called **Hex Editors**, display data as groups of 2 hex digits

5				C			
0	1	0	1	1	1	0	0

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

10

Bits and Bytes

- Everything in a *modern* computer is stored using combination of ones and zeros
- Bit** is one binary digit
 - either 1 or 0
 - shorthand for a bit is **b**
- Byte** is a group of 8 bits
 - e.g. **0010 0100**
 - shorthand for a byte is **B**

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

11

The Byte

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

12

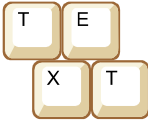

Text in Programming Languages

Press Any Key to Continue

Characters

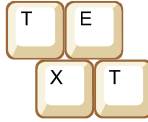

- Computer often store and transmit textual data
- Examples:
 - punctuation
 - numerals 0 – 9
 - letter
- Each of these symbols is called a *character* and are the basis for written communication

6/6/2019 Sacramento State - Cook - CSc 35 - Summer 2019 14

Characters

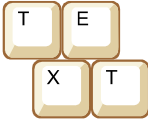

- Processors rarely know what a "character" is, and instead store each as an integer
- In this case, each character is given a unique value
- The letter "A", for instance, could have the value of 1, "B" is 2, etc...

6/6/2019 Sacramento State - Cook - CSc 35 - Summer 2019 15

Characters

- Characters and their matching values are a *character set*
- There have been many characters sets developed over time

6/6/2019 Sacramento State - Cook - CSc 35 - Summer 2019 16

Character Sets

- ASCII
 - 7 bits – 128 characters
 - uses a full byte, one bit is not used
 - created in the 1967
- EBCDIC
 - Alternative system used by old IBM systems
 - Not used much anymore

6/6/2019 Sacramento State - Cook - CSc 35 - Summer 2019 17

ASCII Chart

Control characters

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

7	p	q	r	s	t	u	v	w	x	y	z	{		}	~	DEL

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

19

ASCII Codes

- Each character has a unique value
- The following is how "OMG" is stored in ASCII

	Binary	Hex	Decimal
O	0100 1111	4F	79
M	0100 1101	4D	77
G	0100 0111	47	71

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

20

ASCII Codes

- ASCII is laid out very logically
- Alphabetic characters (uppercase and lowercase) are 32 "code points" apart

	Binary	Hex
A	01000001	41
a	01100001	61

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

21

ASCII Codes

- $32 = 2^5$
- Uppercase and lowercase letters are just 1 bit different
- Converting between the two is easy

	Decimal	Hex	Binary
A	65	41	01000001
a	97	61	01100001

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

22

ASCII: Number Characters

- ASCII code for 0 is 30h
- The characters 0 to 9 can be easily converted to their binary values
- Notice that the binary value is stored in the lower nibble

0	0011 0000
1	0011 0001
2	0011 0010
3	0011 0011
4	0011 0100
5	0011 0101
6	0011 0110
7	0011 0111
8	0011 1000
9	0011 1001

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

23

ASCII: Number Characters

- Character → Binary
 - clear the upper nibble
 - Binary-And 0000 1111
- Binary → Character
 - set the upper nibble to 0011
 - Binary-Or 0011 0000

0	0011 0000
1	0011 0001
2	0011 0010
3	0011 0011
4	0011 0100
5	0011 0101
6	0011 0110
7	0011 0111
8	0011 1000
9	0011 1001

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

24

Unicode Character Set

- ASCII is only good for the United States
 - Other languages need additional characters
 - Multiple competing character sets were created
- Unicode was created to support every spoken language
- Developed in Mountain View, California

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

25

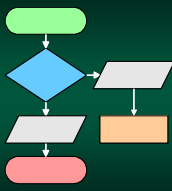

Unicode Character Set

- Originally used 16 bits
 - that's over 65,000 characters!
 - includes every character used in the World
- Expanded to 21 bits
 - 2 million characters!
 - now supports every character ever created
- Unicode can be stored in different formats

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

26

What are Programs?

It's all just a bunch of bytes

High-Level Programming

- You are used to writing programs in high level programming languages
- Examples:
 - C#
 - Java
 - Python
 - Visual Basic

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

28

High-Level Programming

- These are *third-generation languages*
- They are designed to isolate you from architecture of the machine
- This layer of abstraction makes programs "portable" between systems

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

29

Computer Processors

- The *Central Processing Unit (CPU)* is the most complex part of a computer
- In fact, it is the computer
- It works far different from a high-level language

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

30

Computer Processors

- Over time, thousands of processors were developed
- Examples:
 - Intel x86
 - IBM PowerPC
 - MOS 6502
 - ARM

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

31

Instructions

- Processors do not have the constructs you find in high-level languages

- Examples:
 - Blocks
 - If Statements
 - While Statements
 - ... etc

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

32

Instructions

- Processors can only perform a series of simple tasks
- These are called *instructions*
- Examples:
 - add two values together
 - move a value
 - jump to a memory location

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

33

Instructions

- These instructions are used to create all logic needed by a program
- We will cover how to do this during the semester

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

34

Processor Instruction Set

- A processor's *instruction set* defines all the available instructions
- The instructions and their respective formats are very different for each processor

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

35

Registers

Where the work is done

Registers

- In high level languages, you put active data into variables
- However, it works quite different on processors
- All computations are performed using *registers*

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

37

What – exactly – is a register?

- A *register* is a location, on the processor itself, that is used to store temporary data
- Think of it as a special global "variable"
- Some are accessible and usable by a programs, but **many are hidden**

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

38

What are registers used for?

- Registers are used to store anything the processor needs to keep track of
- Designed to be *fast!*
- Examples:
 - the result of calculations
 - status information
 - memory location of the running program
 - and much more...

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

39

General Purpose Registers

- *General Purpose Registers (GPR)* don't have a specific purpose
- They are designed to be used by programs – however they are needed
- Often, you must use registers to perform calculations

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

40

Register Files

- All the related registers are grouped into a *register file*
- Different processors access and use their register files in very different ways
- Some processors support multiple files

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

41

Machine
Language

The raw bytes of your program

Machine Language

- The instructions, that are *actually* executed on the processor, are a series of bytes
- In this raw binary form, instructions are stored in *machine language*

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

43

Machine Language

- Each instruction is in a compact binary form
- Easy for the processor to interpret and execute
- Some instructions take more bytes than others – not all are equal

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

44

Instruction Encoding

- Each instruction must contain *everything* the processor needs to know to do something
- So, if you want it to add 2 registers, it has to specify *which* ones

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

45

Operation Codes

- Each instruction has a *unique operation code (Opcode)*
- This value that specifies the *exact* operation to be performed by the processor
- Assemblers use friendly names called *mnemonics*

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

46

Typical Instruction Format

- The opcode is, typically, followed by various *operands* – what data is to be used
- These can be register codes, addressing data, literal values, etc...

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

47

Machine Code Example (not x86)

ADD %r1, %r2

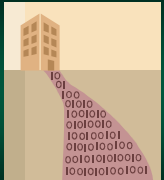

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

48

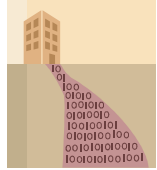

What is Memory?

Its... um.... I forgot....

Computer Memory

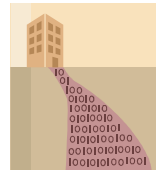

- Programs access and manipulate memory far more than you realize
- So, understanding it...
 - is vital to becoming a great assembly programmer
 - and understanding computer architecture

6/6/2019 Sacramento State - Cook - CSc 35 - Summer 2019 50

What is Memory?

- Memory is essentially an enormous array
- It is also, sometimes, referred to as *storage*
- It stores **both** running programs and their related data

6/6/2019 Sacramento State - Cook - CSc 35 - Summer 2019 51

Memory Addresses

- Memory is divided into a storage locations that can hold 1 byte (8 bits) of data
- Each byte has an *address*
 - unique value that refers to that specific byte
 - used to locate the exact byte the processor wants

Memory	
0	01000100
1	01000011
2	01101111
3	01101111
4	01101011

6/6/2019 Sacramento State - Cook - CSc 35 - Summer 2019 52

What is Memory?

- So, each address is conceptually the same as the "index" in array terminology
- ... and you will write access memory as would an array

Memory	
0	01000100
1	01000011
2	01101111
3	01101111
4	01101011

6/6/2019 Sacramento State - Cook - CSc 35 - Summer 2019 53

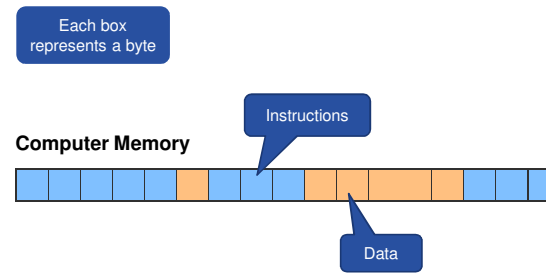

Memory Contains Data & Programs

Each box represents a byte

Instructions

Computer Memory

Data

6/6/2019 Sacramento State - Cook - CSc 35 - Summer 2019 54

Memory Contains Data & Programs

- Data and instructions are just binary numbers (stored in a series of bytes)
- ...and are stored together
- Appreciating this is vital to understanding computer architecture

6/6/2019

Sacramento State - Cook - CSc 35 - Summer 2019

55
